

Awesome axolotl

Most amphibians look different as adults than they do when they're born (think of frogs and tadpoles). But axolotls **don't change** – they just get bigger.

Baby axolotl

Amazing ability

While lots of amphibians can **grow new limbs**, axolotls go one step further. They can also regrow their spines, organs, and even their brains.

Axolotls don't go on land like other amphibians. They enjoy the water too much.

Most axolotls grow to be about my size.

Axolotl is pronounced "AXE-oh-LOT-ul".
