

Darwin's most important discovery came when he visited the **Galapagos Islands**, near South America. He noticed that animals such as finches and mockingbirds were slightly **different** on each island.

Darwin realized that the finches had **changed** over millions of years and **adapted** to their different island habitats.

Darwin wrote about his discoveries, but for years many people didn't believe him. Today, Darwin's discoveries are considered to be very important.

No, no, no! Darwin is all wrong!
