

**OLD RED GIANTS**

Red giants and supergiants appear very distinctive in the sky since they are noticeably red. As they are so large, they are also very luminous, which makes them easy to detect.

**COLLAPSING STAR**

After undergoing its red giant or supergiant stage, the stellar remnant will collapse. If its mass is over 1.4 solar masses, it will collapse to become a neutron star. If the remnant is above about 3 solar masses, it will collapse to become a black hole.
