

## EQUATORIAL SKY CHART 3

This region is best placed for observation on evenings in March, April, and May. It contains the point at which the Sun moves across the celestial equator into the Southern Hemisphere each year. This point lies in Virgo, and the Sun reaches it around September 21. In the northern constellation Boötes lies Arcturus, a notably orange-colored star whose visibility marks the arrival of northern spring. South of it is the zodiacal constellation of Virgo, whose brightest star is the blue-white Spica. Adjoining Virgo is Leo, one of the few constellations that genuinely resembles the animal it is said to represent—in this case, a crouching lion.
