

EQUATORIAL SKY CHART 4

This region is best placed for observation on December, January, and February evenings. It contains the point at which the Sun is farthest north of the celestial equator, on the border of Taurus with Gemini. This occurs around June 21, when days are longest in the Northern Hemisphere and shortest in the Southern. Glittering stars and magnificent constellations abound in this region of sky, including the brightest star of all, Sirius in Canis Major. A distinctive line of three stars marks the belt of Orion, while in Taurus the bright star Aldebaran glints like the eye of the bull, along with the Hyades and Pleiades star clusters.
