

Polar animals

Did you know?

The coats of Arctic foxes turn white in the winter to hide the animals in the snow.

Around the north and south poles it is bitterly cold and windy. But many animals have found different ways to survive here.

Seal

Weddell seals spend winter under the Antarctic ice sheet. They breathe through holes in the ice.

Migration

Reindeer

migrate south from the Arctic in winter to find food and shelter.

Snowy owls also travel south in winter. They feed on Arctic rabbits.

Musk oxen move south from the Arctic in the winter to find grazing land.

Moose travel north to the Arctic shore in the summer to escape all the flies in the south.

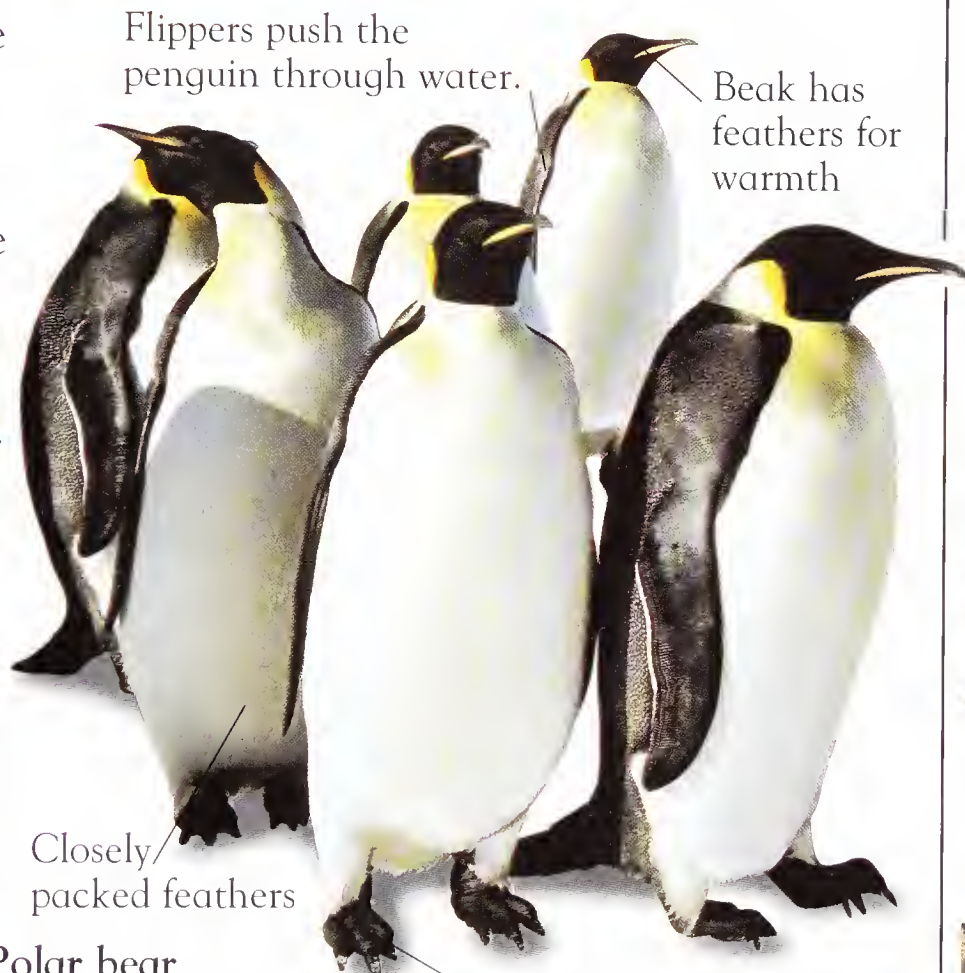

Penguin

Emperor penguins live on the Antarctic ice, huddling together in groups to keep warm. They can't fly, but are expert swimmers.

Wolf

Wolves have hairs under their paws to give them a good grip on ice.

Flippers push the penguin through water.

Beak has feathers for warmth

Closely packed feathers

Feet are small to cut down heat loss.

Polar bear

Polar bears have thick, oily coats to keep out the cold. They are the only mammal to live on the Arctic ice.

Walrus

A thick layer of fatty blubber keeps the walrus warm in cold Arctic seas.

Krill

Krill are tiny shrimp-like animals that live in the seas around Antarctica.
