

Polar lands

The polar lands lie around the north and south poles. The frozen ground and icy climate make them a hard place for plants to grow.

Ice field

A lot of the land in the polar regions is covered by huge sheets of ice, called ice fields.

Glaciers flow from the ice fields.

Glaciers are rivers of ice that move slowly down mountain slopes.

Antarctica

No one lives in the Antarctic, but scientists visit to study the land and its wildlife.

Polar plants

Mosses grow in thick cushions. This protects them from icy winds.

The Arctic wormwood stores food in its roots to help it survive.

Grasses

Grasses grow quickly in the spring when there are long periods of daylight.

Tundra

The tundra is the frozen land in the far north. The ice melts here in the summer, and a few plants manage to grow.

Life in the Arctic

People have lived in the Arctic for thousands of years. They have had to adapt their lifestyle to the harsh climate.

Primroses have long roots to help them survive.

Did you know?

The tallest ever iceberg was higher than St. Paul's Cathedral, London.

Winter coat

Dog-pulled sleds make it possible to move goods across the ice.

Warm clothes are made from animal skins.

Sled

Husky

Fleabane grows only for a few weeks in the Arctic summer.
