

Rain forest animals

Flying animals

Morpho butterflies have bright colors to help them attract a mate.

Scarlet macaws have hooked beaks that can crack open nuts.

Toucans use their long beaks to pick fruit and steal other birds' eggs.

Fruit bats rest during the day in the forest canopy.

Monkeys howl, parrots shriek, and insects chirp – tropical rain forests are noisy places, home to a huge variety of wildlife.

Spider monkey

Monkeys swing through the canopy, gripping the branches with their strong feet, hands, and tails.

Tree snake

These snakes live in trees near water. They eat frogs and lizards.

The monkey's tail can support it from a branch.

Thick, woolly coat

Baby monkey clings to its mother.

Monkeys feed on tasty fruit and leaves.

Jaguar

The jaguar's coat helps hide it in the dappled forest light.

Did you know?

Scarlet macaws can tell each other apart by special patterns on their feathers.

Tree frogs

Tree frogs spend their lives high up in tree branches.

Three-toed sloth

Sloths have hooklike claws that cling on to branches.

Gecko

The gecko's clever camouflage hides it from hungry snakes.

Ants

These ants eat a fungus that grows on the leaves they cut and store.
