

Reptiles

Reptile families

Sinaloa
milk snake

Snakes are expert hunters. They poison their prey or squeeze it to death.

Alligator snapping turtle

Turtles are excellent swimmers. They only come on land to lay their eggs.

Basilisk lizard

Lizards make up over half of all reptiles. They are small, quick, and feed on insects.

Hermann's
tortoise

Tortoises live on land. Their hard shells protect them from their enemies.

Lizards, tortoises, crocodiles, and snakes are all reptiles. Most of them live in warm places, have dry, scaly skin, and lay eggs on dry land.

The scales are like armor for protection.

Strong tail for swimming

Eye

Rat snake

Long, snapping jaws and sharp teeth catch prey.

Webbed feet move like paddles.

Did you know?

Many snakes eat their food while it is still alive!

Crocodile

Crocodiles live and catch their food in rivers. Their bodies are perfect for hunting in water.

Baby caiman

Baby reptiles

Unlike most reptiles, crocodiles take care of their babies for a few weeks after hatching.

Garden lizard

Cold blooded

Reptiles are cold blooded. They need heat from the sun to warm up and shady places to cool down.

Lizard tails

If a lizard's tail is grabbed by an enemy, it can break off, letting the lizard escape. A new tail soon grows back.
