

Sea animals

Did you know?

Flying fish can leap from the water, spread out their fins, and glide through the air.

Salty seawater covers nearly three-quarters of the Earth's surface. Below the waves, the oceans teem with a huge variety of sea life.

Starfish

Starfish cling to the rocky seashores of the Atlantic Ocean. They use their arms to pry open seashells.

Deep-sea hatchet

Named after its big, axlike belly, this hatchet lives in the deep waters of the Pacific Ocean.

Zooplankton

Billions of tiny sea creatures called zooplankton float in all the world's oceans.

Narwhal

The narwhal whale has a twisted tusk and lives in the icy waters of the Arctic Ocean.

Thornback ray

The flat thornback ray hides on the Pacific seabed. It is well camouflaged against the sand.

Dugong

Dugongs are gentle mammals that swim in large herds in the shallow waters of the Pacific.

Octopus

This octopus inhabits the warm coastal waters of the Atlantic. It wraps its prey up in its tentacles.

Sea horse

Sea horses are the only fish that swim upright. They are found among the coral reefs off Africa.

Sperm whale

Huge sperm whales eat tons of plankton a day. They live in the Atlantic and Pacific oceans.
