

Seashore

Did you know?

This crab holds a sea anemone in each of its pincers. If a fish attacks, the sea anemone stings it!

The seashore, where the sea meets the land, is home to a huge variety of plants and animals. They have all had to adapt to saltwater, strong winds, and waves.

Seashore life

Pipefish have very long, thin bodies and hide in seaweed.

Crabs hide in holes in rocks and wave their pincer claws at their enemies.

Sea anemones can't move, but have stinging tentacles that kill their prey.

Seagulls eat almost anything, even dead fish on the beach.

The **goldsinny** is a tiny fish that lives only in tide pools.

Tide pool

When the tide goes out, water is trapped in tide pools. Here, animals and plants can stay safely underwater.

Seaweed
Seaweeds are plants that grip rocks with sticky pads. Their leaves are called fronds.

Shells

Shells of all shapes and sizes can be found on the seashore. Each shell was once home to a sea creature.
