

Trains

Types of trains

Breakdown trains clear fallen trees and broken trains off the tracks.

Crocodile trains pull cars up steep mountains. They can "bend" around corners.

Shunters are mighty engines that push and pull other trains in a train yard.

Freight trains transport heavy loads across the country.

City trains

Subway trains carry passengers under the busy city streets.

Electric track

From the first puffing steam train to the electric "bullets" of today, trains have provided high-speed transportation for people and goods.

Electric train

Most of these are modern, high-speed passenger trains. They get their power from an electric cable above the track.

Electric cable

Did you know?

The first trains ran on tracks, but were pulled by horses!

Diesel train

These trains are powered by engines that run on diesel oil.

Steam train

Early trains used the power of steam to drive their engines.

Smoke from burning coal

In early days, simple signals made railroads safer.

Bell Whistle

Signal

City trains

Subway trains carry passengers under the busy city streets.

Electric track

Monorails run on a single track high above busy roads.

Magnetic levitation (maglev) trains float above a track.

Strong magnets push the train into the air!
