

Water

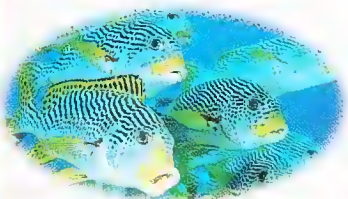

Dissolving

Some things seem to disappear when mixed with water. This is called dissolving.

Dirt dissolves in water. That is why you bathe!

Minerals in rocks can dissolve in water. They sometimes form stalactites in caves.

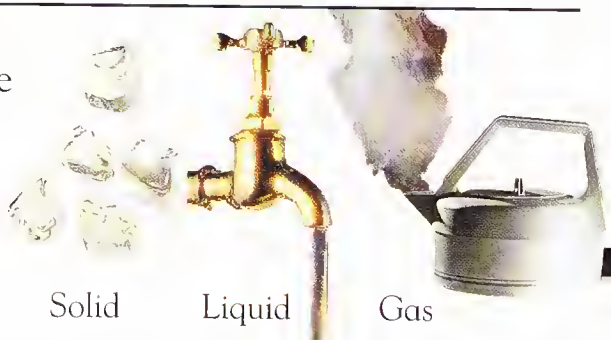

Oxygen dissolves in water. Fish need this oxygen to live.

Salts in rocks dissolve in water. They make seawater salty.

Forms of water

Water can change its form. It can be solid ice, a runny liquid, or steam – a gas that mixes with air.

Solid

Liquid

Gas

Water is the most important liquid on Earth. It has no smell, color, or taste, but without it people couldn't survive.

Water cycle

Water is always moving from the ocean, to the sky, to the land. This is called the water cycle.

3 River

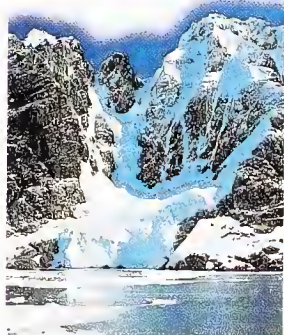

The rain runs into rivers, which flow to the oceans.

Fastflowing stream

4 Ocean

The rivers empty their water into the ocean, and the cycle starts all over again.

Ice

Ice is so powerful it can cut huge valleys into hard rock.

1 Evaporation

The sun's heat turns water into water vapor. This rises, cools, and forms clouds.

2 Rain

Winds blow the clouds over land. Water in the clouds falls as rain, snow or hail.

Water for life

Every living thing needs water to survive.

Did you know?

The Dead Sea in Israel is so salty that people can sit up and float in it without sinking!
