

Animal homes

Different homes

Hermit crabs make their homes in an empty seashell.

Squirrels make warm homes called dreys from twigs and leaves.

Clownfish live among the stinging tentacles of sea anemones.

Tortoises have mobile homes – their hard shells protect them.

Marmosets make a different home every night in the treetops.

Some animals make homes, others find temporary shelters. Whether animals live alone or in groups, their homes protect them from danger or bad weather.

Rabbit warren

Wild rabbits live together in a warren – a system of underground tunnels and rooms.

Entrance is dug into the earth or among tree roots.

When baby rabbits grow up, they also live in the warren.

Baby rabbits live in nests called stops.

Underground rooms called burrows

Termite nest

Termites build amazing nests housing up to five million termites.

Network of cells and tunnels made from dried mud

Some nests are 40 ft (12 m) tall!

Did you know?

A female polar bear and her cubs sleep all winter in a warm den under the snow.
