

Birds

Did you know?

The ostrich is too heavy to fly, but it can run fast!

Birds come in all shapes and sizes and are the only animals with feathers. They have a beak but no teeth, and their babies hatch out of eggs.

Ears are hidden under feathers.

The shape of a bird's beak tells you what it eats.

Eyes are sharp to spot food.

A bird has wings instead of arms.

Tail is used for balance.

Leg

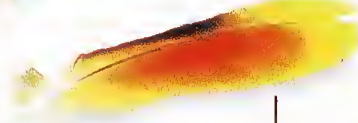

Claws grip branches and grab food.

Feathers

Long tail and wing feathers are used for flight and balance. While soft, downy chest feathers keep a bird warm.

Chest feathers

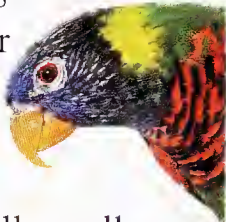

Wing feathers

Beaks and food

Hummingbirds suck nectar with their long beaks.

Parrots crack open hard nuts with their beaks.

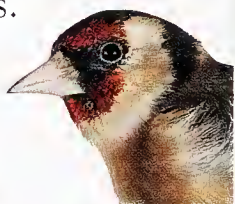

Eagles kill small animals with their sharp beaks.

Flamingos scoop up algae and tiny fish.

Finches peck at seeds and nuts.

Flying

A bird stays up in the air by flapping its strong wings. Some birds can glide on the wind.

The feathers close up and push down against the air.

As the wings rise, the feathers spread apart.

Pigeon
