

Building machines

Did you know?

It would take one man two months to do the same work a backhoe loader does in one hour!

In the past, many great buildings were built by hand and took years to complete. Today's powerful machines make building work much quicker and easier.

Types of building machines

Concrete mixers bring ready-mixed concrete to a site.

Excavators dig out trenches, where pipes and foundations will be laid.

Dump trucks bring all the building materials to a site.

Backhoe loaders dig trenches and then remove the rubble.

Truck loader cranes lift heavy loads to the top of a building.

Bulldozer

A bulldozer clears and flattens the ground, ready for building.

Big steel bucket pushes earth aside

Handheld machines

Not all machines on building sites are huge trucks. Some are much smaller machines.

Pneumatic drill

Cement mixer

Wheelbarrow

Crawler tracks can move over rough ground.

Demolition ball

Demolition balls smash down old buildings so that new ones can be built in their place.

Building site

Many machines are used on building sites. They are busy and dangerous places to work.

Concrete mixer

Crane
