

Fish of the world

There are more than 30,000 different kinds of fish in the world today. Just over half of them live in salty seawater. The others live in freshwater lakes, rivers, and streams.

Leopard shark

This harmless shark lives and hunts in the Pacific Ocean.

European eel

These eels live in European rivers, but travel far out into the ocean to breed.

Piranha

Piranhas are deadly hunters. They live in the rivers of South American rain forests.

Stickleback

Sticklebacks live in the northern Atlantic Ocean. They feed on smaller fish.

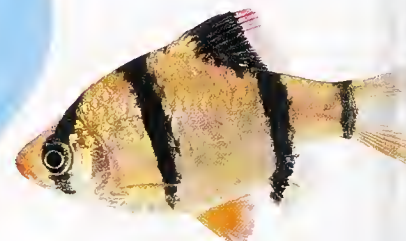

Did you know?

Not all fish live in water. Mudskippers spend a lot of time on land, even up trees!

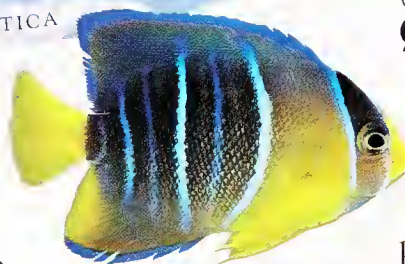

Tiger barb

This tiny, striped fish lives in streams and rivers on warm Pacific islands.

Queen angelfish

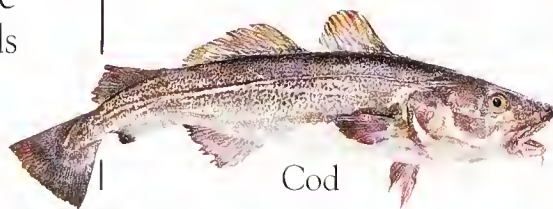

This tropical fish lives in the coral reefs of the Pacific Ocean. Its coloring helps it hide in the coral.

Where fish live

Seas and oceans

Many saltwater fish live near the surface. Some swim in schools deeper down. Still others lie on the seabed itself.

Cod

Butterflyfish

Tropical seas

The warm, shallow tropical seas are home to some of the world's most beautiful fish.

Ocean deep

Only a few fish can survive in the cold, dark water in the deepest parts of the ocean.

Angler fish

Tench

Rivers and lakes

Freshwater fish are often more colorful than the fish of the sea. Different kinds choose to live in still or fast-flowing water.
