

Food and eating

Did you know?

A person eats about 33 tons (30 tonnes) of food in a lifetime – the same weight as six African elephants.

A good diet

The food you eat makes your diet. A healthy diet has food from five different groups. Each group helps your body in a different way.

Proteins help the body grow and repair itself. They are found in meat, fish, dairy products, and nuts.

Digestion

- 1 From your mouth, food goes to your stomach.
- 2 Your stomach juices turn the food into liquid.
- 3 The liquid is squeezed along the intestines. Here the nutrients pass into your blood.
- 4 The leftovers are pushed out when you use the bathroom.

To stay strong and healthy, it is important to eat the right foods. Food gives us energy – plus it's delicious to eat!

Vitamins and minerals in fresh fruits and vegetables help fight disease.

Fat is found in oil, butter, and avocados, and is stored in the body for extra energy.

Carbohydrates give you energy. They are found in rice, potatoes, and pasta.

Fiber helps food move through your intestines. Cereals, nuts, beans, and bread all contain fiber.

Water

Your body needs about 5 pints (3 liters) of water every day.

Preserving food

Dried foods, such as beans and herbs, have all their water removed.

Pickled foods, such as fruits and vegetables, are preserved in vinegar or a sugary syrup.

Canned foods, like fruit, fish, and meat, are packed in liquid in a sealed can.

Frozen foods, such as meat, fish, and vegetables, keep well for several months.

Smoked foods, such as fish and bacon, are dried, or cured, in a room full of smoke.
