

Forest animals

Did you know?

Wolves pull faces to show other wolves how they are feeling: angry, sad, or happy!

The forest makes a wonderful home for animals. The trees provide them with everything they need – food, hiding places, and shelter from the cold.

Squirrel

Squirrels feed on nuts, cones, and insects.

Badger

Badgers live in underground burrows. They hunt at night.

Powerful jaws tear out tough roots.

Forest birds

Woodpeckers

drill holes into trees to make nests and eat insects under the bark.

Crossbills have twisted beaks, which they use to open cones.

Jays feed on seeds, but they also steal eggs from other birds' nests.

Tawny owls spend all day hiding in a tree, then come out to hunt at night.

Raccoon

Raccoons climb trees to steal eggs from nests.

Thick fur to keep warm

Strong claws can dig out roots and grip trees.

Grizzly bear

Bears feed on plants, tree roots, and small animals. They are well adapted to forest life.

Strong legs for climbing trees

Forest mini-beasts

Earthworms

drag dead leaves under the soil, which makes it more fertile.

Wood ants live in colonies of up to 100,000 ants. They eat other insects.

Millipedes

scurry through the leaves on the forest floor.

Weevils

help break down dead plants.

Centipedes live in the soil, catching small animals with their special claws.
