

Forests

Deciduous forest

A deciduous forest contains a mix of different trees. Most of them lose their leaves in the fall, and grow new ones in the spring.

Horse chestnut leaf

Forests grow in many different parts of the world. There are three main types of forests: coniferous, deciduous, and rain forest.

Fall leaf color

Trees are a rounded shape.

Variety of trees

Deciduous forest plants

Mushrooms help decompose dead plants, keeping soil fertile for growth.

Primroses bloom in the spring, before the leaves on the trees block out the sun.

Mosses are small, flowerless plants that grow in damp places.

Bluebells cover the forest floor with a carpet of purple flowers.

Oak leaf in fall

Maple leaf in fall

Leaves

The broad, flat leaves change color in the fall.

Mountain ash blossom

Blossom

Trees grow flowers to attract insects.

Seeds

Seeds often grow inside a tasty fruit.

Mountain ash berries

Oak leaf

Coniferous forest

Coniferous forests contain evergreen trees, which can survive very cold weather. Evergreens shed some needles all year round.

Snow slides off the branches.

Trees are a triangular shape.

Leaves

Leaves, called needles, are thin and tough.

Pine needles

Spruce cones

Pine cones

Cones

Seeds are protected inside a cone.

Poor, infertile soil

Did you know?

If polluted air mixes with rain, it can make acid rain. This harms forests by damaging the leaves on trees.
