

Grassland animals

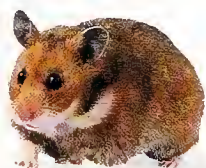

Burrowing animals

Meerkats live in Africa in large groups under the ground.

Wild guinea pigs are found in South America. They live in the old burrows of other animals.

Wild hamsters live in Russia. To stay safe, they leave their burrows only at night.

Dingos are wild dogs that come from Australia. They live in other animals' burrows.

Many grassland animals have their food right under their feet! But life can be dangerous because there is nowhere to hide from predators.

Savanna animals

The savanna grasslands of Africa are home to huge herds of animals. They roam together looking for food and water.

Giraffes eat leaves off the scattered trees.

Wildebeests move around in huge herds. They are safer that way.

Echidna

Echidnas live in the Australian grasslands. In danger, they roll up, showing only their spikes.

Wallaby

Wallabies live and feed in the Australian grasslands. They can move very fast when in danger.

Did you know?

The fastest human runs 329 ft (100 m) in just under 10 seconds. But the cheetah can run it in 3.6 seconds!

Rhea

Rheas live in South America. They can't fly, but can run very fast from their enemies.

Serval

Servals are wild cats that live in Africa. They run very fast and have excellent hearing.

Secretary bird

Secretary birds have such long legs that they can walk through tall grasses. They live in Africa.
