

Human body: growth

Did you know?

At the age of two years, a boy is half his adult height!

Starting life

An **embryo** is a group of cells that grow into a baby inside the mother.

This 10-week-old **fetus** has grown from the embryo.

This five-month-old **fetus** looks like a tiny human.

A **newborn** baby sucks milk from its mother.

From the moment our lives begin, our bodies are always changing. Our minds grow, too, as we learn more about the world around us.

Growing up

It takes about eighteen years to become a fully grown adult.

Young teenager

Fully grown adult

Baby

Elderly adult

Child

Boys and girls

Boys' and girls' bodies and minds grow and develop at different rates.

Height

The height you reach largely depends on your parents. If they are both tall, it is likely that you will be tall, too.

Developing skills

Crawling starts at about 10 months.

Walking begins at about 15 months.

Speaking in full sentences begins at about two.

Writing starts at around the age of four or five.

Riding a bike is often mastered by the age of five or six.
