

Human body: senses

Sight, sound, touch, smell, and taste – your five senses tell your brain what is happening around you and help keep you safe.

Sound

Sound lets us enjoy music. But it also warns us of danger, like a buzzing bee.

Working together

Your senses often work together. When you cross the road, you use your eyes to see and your ears to hear.

The five senses

Touch

A rabbit is soft to the touch, but a hot pan can burn.

Touch

Sound

Taste

Taste

Taste tells you that ice cream is good to eat, but soap is not!

Smell

Your sense of smell lets you enjoy a rose. But it also warns you of sour milk or rotten eggs.

Sight

Your sight lets you thread a needle, and warns you not to touch a prickly cactus.

Sight

Smell

Sight problems

Guide dogs are trained to help blind or partially sighted people get around.

Braille is a form of writing that blind people "read" by touch.

Hearing problems

Sign language helps people who can't talk or hear communicate.

Hearing aids help people who can't hear well.

Did you know?

Our sight is so sharp we can see a candle flame 1 mile (1.6 km) away in the dark!
