

Insects of the world

American locust

A swarm of locusts may contain up to 10 billion insects. They will eat all the plants in their path.

Insects live everywhere in the world except in the ocean. They make their homes in trees, in the ground, in buildings, and even on us!

Great diving beetle

This European pond dweller is fierce – it will even attack frogs.

Checkered skipper

This butterfly can survive in the freezing Arctic. It eats grass.

Did you know?

Whirlygig beetles have a set of upper eyes to see above water, and a set of lower eyes to keep watch underwater!

Robber fly

This fly lives near beehives in South America. It kills bees in mid-air and eats them.

Asian violin beetle

This beetle is totally flat! It lives between thin layers of fungi on tree trunks.

Head louse

This head louse, magnified many times, lives on human heads. It feeds on dead skin.

Praying mantis

This praying mantis lives in Africa and feeds on other insects. It grasps its prey between its two front legs.

Damsel fly

This damselfly lives in southern Europe. It skims over water, feeding on flies.

Cockroach

Cockroaches live almost everywhere. They are scavengers and eat anything from paper to dead animals.

Goliath beetle

The Goliath is the heaviest beetle in the world. It lives in the African rain forest, eating tropical fruit.
