

Light

Light rays

Light rays can travel through some materials.

Transparent

materials like glass allow light rays to travel through them.

Translucent

materials, such as plastics, let some light rays through.

Opaque materials, like wrapping paper, do not let any light rays through.

Reflection

When light rays bounce off shiny things, like still water, they make a reflection.

Did you know?

People still tell the time by using the shadows on a sundial.

It's impossible to think of a world without light. Light is a kind of energy that you can see. Without it, nothing can live or grow.

Light and shadow

Light travels in straight lines called rays. When light rays hit something solid, the light is blocked and a shadow forms on the other side.

The Sun is our planet's most important source of light.

Hand shadows

It's fun to make shadows with our hands.

Plants and light

Plants need light to make food for themselves. They die if they are left in the dark.

Leaf in light

Leaf in dark

Plants grow toward light.

Types of light

Electric light is powered by electricity and

used in buildings and outdoors.

Candlelight

was used to light homes in the past.

Glowworms

use special chemicals to make their light.

Lightning is a kind of electricity. It makes a flash of bright light.

Fireworks explode to make a beautiful, chemical light.
