

# Oil

## Fuels from oil

Different parts of the crude oil are used to make other fuels.

**Propane gas** can be stored in bottles and tanks and used for cooking and heating.

**Paraffin oil** is used in lamps and heaters. It is also mixed into paint to make it smooth.

**Oil** is used as a lubricant. It helps machine parts slide against each other.

**Gasoline** is one of the most important products of oil. It is a fuel for cars.

Oil is formed over millions of years. It is found deep inside the Earth, and is pumped out to make many different kinds of fuel.

## Oil rig

Drills on an oil rig dig deep into the seabed for oil and gas, which is then pumped up and taken to the shore via pipes.

## Crude oil

Crude oil is the thick, dark liquid that comes out of the ground.

## Nodding donkey

This is a small oil rig that pumps up oil found under land.

Gases are burned off.

Workers live on an oil rig for weeks at a time.

The oil rig's concrete legs rest on the sea bed.

## Drilling

Holes called wells are drilled deep underground to collect the oil.

## Drill bit

The bits have strong steel teeth to cut into hard ground.

## Oil refinery

Crude oil is taken to a refinery. Here it is heated until it separates into different parts.

## Did you know?

Drill bits get so worn down by the hard rock that they need replacing twice a day.
