

Conservation

Did you know?

If all the aluminum cans thrown away in a year were put end to end, they would stand 50 times higher than Mount Everest.

Conservation means looking after the Earth's resources – plants, animals, air, water, and land. It's a world problem, but one that begins at home.

Recycling

Recycling means collecting old materials and using them to make new materials.

1 Used glass bottles are collected at home.

2 Used glass is put into special collection bins.

3 Glass is taken to a recycling factory.

Each bin is for different materials.

Glass is melted down to make new products.

Recycled glass bottles

Clean water

Garbage and poisons pollute water. This can be dangerous.

People, plants, and animals need clean water to live.

Dirty, polluted water causes sickness and infection.

Clean Earth

Chemicals and garbage pollute the land. They stay in the soil for many years.

Picking up litter keeps the environment clean.

Organic crops are grown without chemicals – keeping the soil clean.

Clean air

Cars use fuel and pump dirty exhaust fumes into the air.

Cycling is a clean form of transportation. It does not pollute the air.

Energy

Burning fuels to make electricity uses up resources.

Recycled glass bulb

Switching off lights saves energy.

Modern wind machines produce electricity without burning fuels.
