

Fish

Did you know?

Male catfish carry the females' eggs inside their mouths until they hatch.

Fish live in the world's rivers, lakes, and oceans. The way fish look, move, and breathe is perfectly suited to their underwater life.

Fins help fish steer.

Tail fin works like a paddle

Goldfish

A fish's body is smooth and streamlined, just like this goldfish. It is the perfect shape for moving quickly through water.

Gills

Eye

Scaly skin

Types of fish

The **mackerel** is a bony fish, the largest group of fish.

Lampreys are part of a small group called jawless fish.

This **leopard shark** is a member of the shark group.

Breathing

Fish breathe underwater with their gills. These take oxygen from the water as the fish swims along.

Water goes in through the mouth.

Water comes out of the gills.

Eggs

Most fish lay millions of jellylike eggs straight into the water. This is called spawning.

Defense

A school of dart fish is harder to attack than one fish on its own.

Long spines make the pufferfish almost impossible to swallow!

Camouflage helps flounders blend in with the seabed.

Torpedo rays give an electric shock when they are attacked.
