

Flowers

Did you know?

The Venus's-flytrap gets extra food by trapping and digesting small insects!

We love flowers for their color, shape, and scent. Yet their loveliness is not for us; it's to attract small creatures to visit them.

Petal

Petals come in many shapes, sizes, and colors to attract insects and birds, which pollinate the flowers.

Lily

Flowers can look very different from each other, but they all have the same basic parts – just like this lily.

Rose

Perfume

Many flowers have a sweet smell and are used to make soaps, oils, and perfumes.

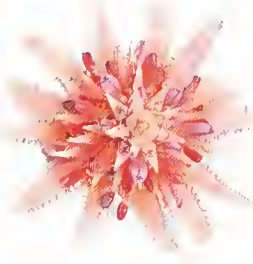

Unusual flowers

Water lily flowers float on water.

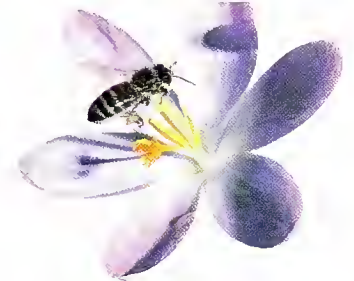

Grasses have dull flowers.

Urn plants have red flowers to attract birds.

Catkins are groups of tiny flowers found on some trees.

1 A bee visits a flower to feed on its sweet nectar.

2 As the bee feeds, pollen on the stamens sticks to its legs.

3 At the next flower, the pollen brushes onto the stigma.

4 This flower is now pollinated, and can begin to make seeds.
