

Machines

Did you know?

The Greek scientist Archimedes invented a pulley that would allow one man to pull a ship in or out of water.

People have always used machines to make their lives easier. Simple machines like wheels, pulleys, and levers help us in dozens of ways every day.

Lever

Levers help lift loads. They have a rod or bar that turns around a pivot.

This corkscrew uses levers to lift a cork out of a bottle.

Scales

This pair of scales is a lever.

Scissors are two levers joined together.

Bicycle

Bicycles are machines that use pedal power to carry us faster and farther than walking does.

The wheel spins around on the axle.

Gear

Gears are wheels with teeth that fit into each other. Gear wheels change the speed at which parts of a machine work.

Hand beater

The gears in a watch make the different hands move at different speeds.

Inside a watch

Gears give power on hills.

Pedals are levers to push against.

Wheel

Wheels turn around an axle. They are used to move things smoothly.

Slope

We use slopes in many machines. Rolling something up a slope is often easier than lifting it straight up in the air.

Pulley

A pulley uses a wheel and a rope to lift very heavy loads.

Pulley

Cranes use pulleys to raise and lower loads.
