

## Relative, not absolute

Always remember that note values are not measured in seconds, they are measured in relation to each other. A quarter note is always half as long as a half note, and a sixteenth note is always half as long as an eighth note. A half note is always twice as long as a quarter note, and a whole note is always twice as long as a half note.

- 8 ▽ **Note values**  
The chart below shows how the note values relate to each other. Each column represents one quarter note, so the whole note stretches across four quarter notes.
