

Atacama Desert

Setting yet another world record, the Atacama Desert in northern Chile is the driest place on Earth. Its average rainfall is no more than 0.04in (1mm) a year, and for 400 years, it didn't rain at all!

Andes Mountains

The Andes are a continuous chain of mountains that run for more than 4,400 miles (7,000km) down the west coast of South America. The Andes are also the highest mountain range in the world outside Asia, rising up to 22,841ft (6,982m) above sea level at Mount Aconcagua in Argentina.

Pampas

Stretching across northern Argentina, Uruguay, and the southernmost tip of Brazil are the vast grassy lowlands known as the Pampas—a local Quechua word meaning “plain”. With fertile soil, a mild to warm climate, and an even rainfall, they are ideal for growing wheat and soybeans, and for grazing cattle and sheep.

Cape Horn

Right at the bottom of the continent lies Cape Horn, named by Dutch sailors after the city of Hoorn in the Netherlands. The Atlantic and Pacific oceans meet here, and generations of sailors have lost their lives to its notorious waters, battling through the stormy winds and large waves.
