

VENERA 7

Space probe

The rocket engine propelled the craft to Venus

Venera 7 provided confirmation that **man could not survive on Venus's surface.**

Russian space probe Venera 7 was the first to land on another planet – Venus. It crash-landed after plummeting through the planet's thick atmosphere, but was able to relay data for 23 minutes. It revealed that the atmospheric pressure on Venus was 90 times greater than on Earth's surface, and that the temperature was a searing 475°C (887°F) – hotter than any oven on Earth.

Only the egg-shaped lander went to the surface

Space exploration

DATA FILE

SIZE: Lander – 1 m (3 ft) long

DATE OF LAUNCH: 17 August 1970

MISSION DURATION: 3 months, 28 days (last contact)

SPACE AGENCY: Russian space program
