

VOYAGER 1

Space probe

Space probe Voyager 1 swung past Jupiter on 5 March 1979 and Saturn on 12 November 1980, and sent back sensational pictures of our Solar System's two gas giants. It captured astonishing images of Jupiter's clouds, its Red Spot, and its volcanic moon Io. When the probe reached Saturn, it swept over the planet's glorious rings.

DATA FILE

SIZE: 3.7 m (12 ft) – width of antenna

DATE OF LAUNCH: 5 September 1977

MISSION DURATION: Ongoing

SPACE AGENCY: NASA

Voyager 1 has now left our Solar System and is travelling in interstellar space.

This system lets the cameras check their colour balance

Great Red Spot as seen by Voyager 1
