

FALCON 9

Reusable rocket

Falcon 9 was the first powerful, privately built rocket. With its Dragon capsule, it pioneered the commercial delivery of cargo to the International Space Station (ISS). The first stage of the Falcon 9 returns to Earth and can be reused in future flights, while the Dragon capsule is now being upgraded to carry astronauts into space.

On 8 April 2016, Falcon 9 completed the **first vertical landing** by a space rocket.

DATA FILE

SIZE: 70 m (230 ft) tall

FIRST LAUNCH: 4 June 2010

NUMBER OF MISSIONS: 25

ORGANIZATION: SpaceX
(private company)

Dragon capsule delivers payloads such as satellites into space

First-stage engines burn kerosene and liquid oxygen
