

THE NORTHERN SKY

From Earth about 6,000 stars are visible to the naked eye in the night sky, though you can only see about half of these from any location at any one time. Ancient astronomers saw the night sky as a giant sphere of stars, or celestial sphere, surrounding Earth. The stars and constellations of the northern half of this sphere are shown on this flat sky map.

KEY

- ★ YELLOW STAR
- ★ RED STAR
- ★ ORANGE STAR
- ★ WHITE STAR
- ★ BLUE STAR

Polaris, or the Pole Star, remains directly over Earth's north pole.

NORTHERN SKY

Most of the constellation names in the northern hemisphere come from the ancient Greeks. They are often linked to myths, such as the story of Perseus and Andromeda, but some of the fainter stars lie in constellations with more modern names.
