

HERCULES

This constellation is named after Hercules, the strong man of Greek mythology. It is faint, but it hosts M13, a globular cluster of about half a million stars that is visible to the naked eye.

DATA FILE

SIZE RANKING: 5th

BRIGHTEST STAR: Kornephoros

MONTH WHEN BEST VISIBLE: July – Northern hemisphere

LYRA

The Lyre

Lyra boasts Vega, the fifth-brightest star in the sky. The Ring Nebula – the faint remains of a star that puffed off its atmosphere in its death throes – is visible through a telescope.

DATA FILE

SIZE RANKING: 52nd

BRIGHTEST STAR: Vega

MONTH WHEN BEST VISIBLE: August – Northern hemisphere
