

DARK MATTER AND DARK ENERGY

One of the most amazing things that scientists have discovered is that most of the Universe is dark and invisible. Galaxies are held together by the gravity of dark matter, probably made of tiny subatomic particles filling space. On a larger scale, a mysterious force called dark energy is ripping the entire Universe apart.

DATA FILE

YEAR OF DISCOVERY (DARK MATTER):
1933

EVIDENCE (DARK MATTER): Excessive power of gravity controlling galaxies

YEAR OF DISCOVERY (DARK ENERGY): 1998

EVIDENCE (DARK ENERGY): Acceleration of the Universe's expansion

One of the hundreds of galaxies making up this galaxy cluster
