

CANIS MAJOR

The Large Dog

This constellation contains Sirius, or the “Dog Star”, the brightest star in the night sky. It is not actually that bright, but only appears so because it lies nearby – only 8.6 light years away.

DATA FILE

SIZE RANKING: 43rd

BRIGHTEST STAR: Sirius

MONTH WHEN BEST VISIBLE:
February – Southern hemisphere

CANIS MINOR

The Little Dog

The constellation has one bright star: Procyon. In Greek, its name means “before the dog”, because its rising heralded the appearance of Sirius.

DATA FILE

SIZE RANKING: 71st

BRIGHTEST STAR: Procyon

MONTH WHEN BEST VISIBLE:
March – Northern hemisphere
