

TYPES OF STAR

Most stars – including our Sun – are bright, hot balls of gas that are powered by nuclear reactions deep inside their core. Our Sun is quite an average, middle-of-the-road type – known as a main sequence star – but others encompass unbelievable extremes of size, brightness, and temperature. The more massive a star, the hotter and brighter it glows.

**Red
supergiant**

With a surface temperature of 5,500°C (9,930°F), the Sun shines with a yellow colour

**White
dwarf**

**Red
dwarf**

**Yellow main
sequence**

A supergiant star emits a powerful bluish light

**Blue
supergiant**
