

STAR CLUSTERS

A giant ball of more than a million stars, the globular cluster NGC 2808 is around 12.5 billion years old, about the same age as our Milky Way.

The Butterfly Cluster, in the constellation Scorpius, contains less than 100 stars. It is one of the largest and brightest clusters in the Milky Way.

You could fit **five billion Suns** inside the biggest star, **UY Scuti**.

DATA FILE

SMALLEST DWARF STAR: Sirius B, white dwarf, 11,700 km (7,270 miles) across

LARGEST STAR: UY Scuti, red supergiant, 2.4 billion km (1.5 billion miles) across

BRIGHTEST STAR: R136a1, 9 million times brighter than the Sun

CLOSEST STAR TO THE SUN: Proxima Centauri, 4.24 light years away

Blue
hypergiant
