

Mercury's huge iron core is 3,600 km (2,235 miles) wide, making up the bulk of the planet

The planet's mantle is composed of silicate rocks, and is far less dense than its core

Mercury's surface is a single, solid shell, unlike Earth's crust, which is made of moving plates

Mercury has a very thin atmosphere, most of which has been blown away by the solar wind

DATA FILE

Earth

TIME TO ROTATE ONCE: 59 Earth days

YEAR: 88 Earth days

NUMBER OF MOONS: 0

SURFACE TEMPERATURE:
-180 to 430°C (-292 to 806°F)
