

VENUS

Venus is Earth's twin in size, but that is where the similarity ends. Unlike our life-friendly planet, Venus is covered in a thick layer of cloud that traps the heat, caused by active volcanoes. Its temperature is hotter than an oven, its carbon-dioxide atmosphere is laced with sulfuric acid, and the air pressure is 90 times that on Earth. If you went to Venus, you would be roasted, corroded, suffocated, and squashed.

Using radar, astronomers have mapped the parched, volcanic surface of Venus

The core of Venus is made of iron

The Dali Chasma is a 2,000 km (1,243 mile) long network of long canyons and valleys
