

EARTH

After 4.6 billion years, **the plates in Earth's crust still shift**, causing earthquakes.

Our world is special. At 149.6 million km (93 million miles) from the Sun, it is the only planet boasting huge oceans of liquid water, rivers, and seas. Water is essential for life; and life, in all its forms, teems on Earth. Life on Earth began soon after our planet had cooled from the hot bombardment from asteroids and meteorites.

Earth's atmosphere is made up of nitrogen and the essential gas oxygen, which we need in order to breathe

Earth's oceans contain about 97 per cent of the planet's water
