

URANUS'S MOONS

Uranus boasts at least 27 moons. The most remarkable is tiny Miranda, just 500 km (310 mile) across. Its crumpled surface is riddled with grooves, craters, and cliffs. The moon was probably smashed apart by a huge impact in the past, before it re-formed. Uranus hangs in Miranda's sky in this artist's impression.

At 5,000°C (9,000°F), Uranus's core is nearly as hot as the Sun's surface

The planet's mantle is a slushy mixture of water, ammonia, and methane

Uranus **rolls on its side** as it orbits the Sun.
