

NEPTUNE

Neptune was the last planet to be discovered, and was found thanks to the power of maths. Astronomers had discovered that Uranus wandered off its predicted path as though pulled by an unknown planet's gravity. When they calculated where the mystery planet should be and looked through a telescope, they found Neptune. This gas-giant is noticeably active. It has a hot core that drives its storm-systems and dark spots.

The planet's atmosphere is made of hydrogen and helium, with methane providing the blue colour

DATA FILE

Earth

TIME TO ROTATE ONCE: 16.1 hours

YEAR: 165 Earth years

NUMBER OF MOONS: At least 14

CLOUD-TOP TEMPERATURE:
-201°C (-330°F)
