

DWARF PLANETS

Makemake

Haumea

Eris

Pluto

The four largest Kuiper Belt Objects are called “dwarf planets”, because, like the planets, their gravity is powerful enough to pull them into a spherical shape. Pluto is the biggest, slightly smaller Eris is the heaviest, while the others are Haumea and Makemake.

Pluto's name was suggested by an **11-year-old British schoolgirl**.

Fresh white ice – made of frozen water, methane, and ammonia – may be exposed after a collision

The surface of a KBO turns reddish after exposure to the radiation in space

This giant belt of icy bodies extends 30–50 times further from the Sun than our planet. A larger icy zone called the Oort Cloud lies beyond this belt.
