

KONSTANTIN TSIOLKOVSKY

1857–1935

Tsiolkovsky, the most prominent crater on the Moon's far-side, is named after him.

Konstantin Tsiolkovsky is regarded as the father of spaceflight. He was fascinated by the concept and design of rockets, but was not taken seriously by his fellow scientists. Though he never launched a rocket, he imagined the possibilities of human spaceflight. In 1903, he published a book – his key work on rocketry – and its ideas would inspire and contribute towards the work of future generations of rocket scientists.

DATA FILE

KEY ACHIEVEMENT: Developed theory of spaceflight

COUNTRY OF ORIGIN: Russia

YEAR OF ACHIEVEMENT: 1903
