

Striped snake

Not all maple leaves are hand-shaped. This snakebark maple leaf is shaped like an arrowhead. Snakebark maples have striped bark, so can you guess how they got their name?

↖ This snakebark leaf has jagged edges and a pointed tip.

Leaves within leaves

Some leaves look as if they have been cut into smaller leaves with a pair of scissors. Ash trees have leaves like this. They are called compound leaves.

RUB A LEAF

You can make a record of vein patterns by laying a leaf from a broad-leaved tree upside down and putting paper over it. Rub the paper gently with a crayon and see the pattern appear. Remember to label your leaf rubbing when you have finished.
