

Owl pellet

A clump of fur and bones beneath a tree shows that an owl has roosted nearby. Soak the pellet in water and gently tease it apart with tweezers to find out what the owl has eaten.

These tiny mammal bones belong to a vole or mouse.

Sycamore seeds

Winged seeds or "keys" on a woodland floor mean sycamores, ash, or maple trees are growing nearby. Try to match the seed to the tree.

Jay feather

Discarded feathers tell you which birds are found in a forest.

A bright-blue feather like this belongs to a jay. See what others you can find and identify.

Hazelnuts

Where there are nuts, there are nut eaters. Look closely at holes in hazelnut or acorn shells to find teeth marks left by hungry voles, squirrels, or mice.

Voles open nuts with their sharp teeth.
